

SETTING UP VISUAL STUDIO

VISUAL STUDIO FOR MAC OSX

www.visualstudio.com/vs/community/

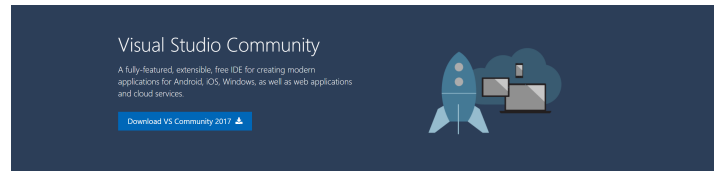

If you already have the newest version of Visual Studio installed, you may skip to step 3.

Note that Visual Studio for Mac does not support C++ development. For classes based in C++, the Mac version of Visual Studio is not suitable.

1a - Download

Download Microsoft Visual Studio Community Edition from the following link:

www.visualstudio.com/vs/community/

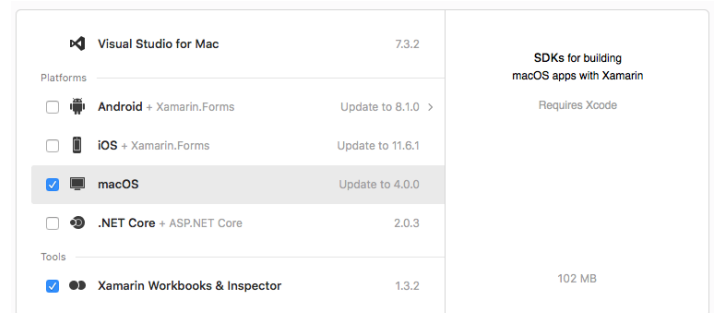

1b - Install

Once the Visual Studio has been downloaded, run it to start the install.

2 - Set Up

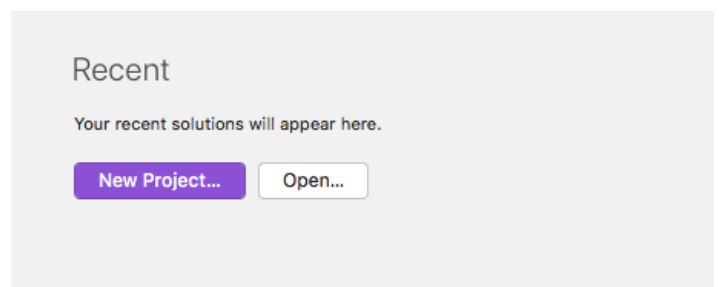

You'll need to make sure to install the appropriate tools. For desktop development, what you'll need is the option marked macOS. This will most likely take some time to complete.

3a - Create a New Project

Once the setup and installation has been completed, you'll want to create a new project. Select the "New Project..." button to get started.

Make sure you create a new project and not a new file.

3b - Configure project

Next, you'll need to set the options for your project. On the left, under "Mac", select "App". Click next and enter your application's information.
